Accredited method

u.r. = underrepresented; ü.r. = overrepresented; k = counted without pollen from nectarless plants (P)

*HD = Honeydew; **Starchgrains in % per 300 pollen- and starchgrains counted

^Weighing, ^^Adjustment in volume and temperature, ^^Matrix: only Honey

***According to the Directive 2001/110/EC, as of 14 June 2026, also honey, which have been obtained by removing foreign inorganic or organic matter in such a way as to result in the significant removal of pollen (filtered) is classified as baker's honey

The expanded relative measurement uncertainty is 5 % (electr. conductivity) (coverage factor $k=2.58$; confidence interval 99 %) without taking the sampling into account.

Conclusion:

Based on the results determined within this analysis the honey can be classified as Blüten/Blossom honey according to current EC Directive for honey.

Based on the above determined characteristics a declaration as Blüten/Blossom honey is in accordance with Art. 2 (2b) of the current EC-Honey Directive.

A declaration of the geographical origin China is consistent with the above determined pollen spectrum given current scientific research.

The increased yeast content could lead to a complaint. Due to the inconspicuous (without signs of fermentation) sensory, we believe that in this case there are no objections to the marketability.
